Do you have Boneseed on your property?

Finally, at long last, the Spring equinox has passed which means surely the gods of rain will turn the tap down to a trickle and let Spring arrive. Hopefully La Niña will find WA too far to travel to and we will get to enjoy some lasting sunshine. We have rustling in the gutters with Racehorse Lizards basking, and sending rats scurrying. No doubt there will be a few of the snakey things hiding under some rocks too, but I for one will not go looking. I will however be hunting for Boneseed!

Darlington Resident Kathryn Batchelor contacted us recently to spread the word about Boneseed. She has asked that each of us takes a good look around our gardens and verges, and to remain vigilant when we are out and about. With community help surely it can be eradicated.

Boneseed is a major weed of natural bushlands in eastern Australia and has been found in a number of locations in the Perth hills and wheatbelt towns. Spread by birds, boneseed can outcompete native vegetation and lead to dominant stands. In eastern Australia it has been shown to restrict the ability of Koalas to move between trees. It is a Weed of National Significance, and has been found in several residential properties in Darlington;

along Ryecroft, Leithdale and Hillcrest Roads. It has also been found in the creek line near the intersection of Camden and Pitterson Road. A population was in Greenmount National Park too.

Boneseed is a declared pest plant in Western Australia and is subject to eradication. It's not known how it arrived here but was probably once sold in nurseries before the 1980s. Several years of management and surveillance have been applied since 2006, and by 2022, only occasional plants are found at most sites. Seed longevity is greater than 10 years.

One of the challenges with surveillance for this plant is getting access to inspect private properties. Last year, a large plant was found in the rear garden of a house on Ryecroft. There are very likely to be more plants in the area, particularly in overgrown rear gardens. The mature plants have a yellow daisy like flower, and the undersides of the young leaves near shoot tips have what looks like cobweb fluff which is more obvious when the leaves are rubbed. Each mature plant produces thousands of berry like seeds, that start green and mature to black.

If eradication of boneseed from Darlington is to succeed, private landholders need to be more familiar with the vegetation on their properties. If you think you have boneseed, you can send an image via the Department of Primary Industries and Development MyPestGuide app, or contact me with an image at Kathryn.batchelor@csiro.au. If it is found to be boneseed, its removal will be arranged with the relevant authority. Note there is no cost for removal, or penalty for a landholder that has boneseed on their property. For more information see <https://www.agric.wa.gov.au/declared-plants/boneseed-declared-pest>
